

# CREATE NODE RED FLOW TO GET DATA FROM DEVICE

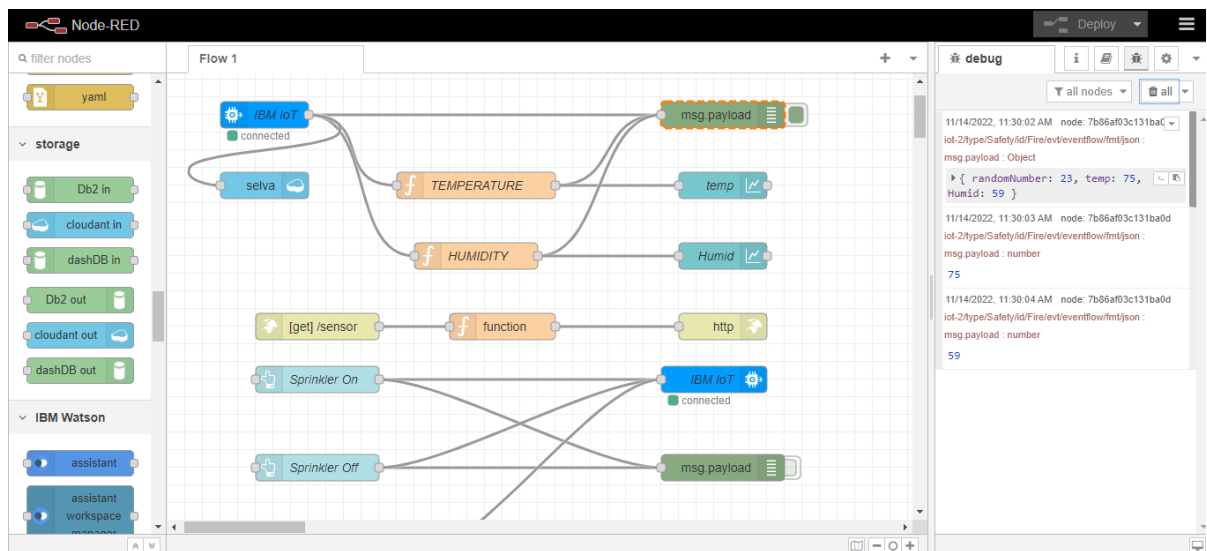

The image shows the IBM Watson IoT Platform interface. The main view displays a table of recent events for a device named 'Fire' (Status: Disconnected, Device Type: Safety). The table has columns for Event and Value. The events are of type 'eventflow' and contain JSON payloads with random numbers, temperature, and humidity values.

Event	Value
eventflow	{"randomNumber":23,"temp":75,"Humid":59}
eventflow	{"randomNumber":79,"temp":75,"Humid":59}
eventflow	{"randomNumber":64,"temp":87,"Humid":90}
eventflow	{"randomNumber":46,"temp":98,"Humid":86}
eventflow	{"randomNumber":64,"temp":43,"Humid":88}

Below the table, it shows the event type configuration for 'eventflow'. The configuration includes a schedule of 'Every Minute' and a payload template:

```
{
  0: {
    1: "randomNumber": random(0, 100),
    2: "temp": random(0, 100),
    3: "Humid": random(0, 100)
  }
}
```

The event type is configured to send data every minute. The payload is a JSON object with three fields: 'randomNumber', 'temp', and 'Humid', each generated by a random function.
